IT Event & System Monitoring Lab : Supporting evidence

Student Name: Navroop Kaur

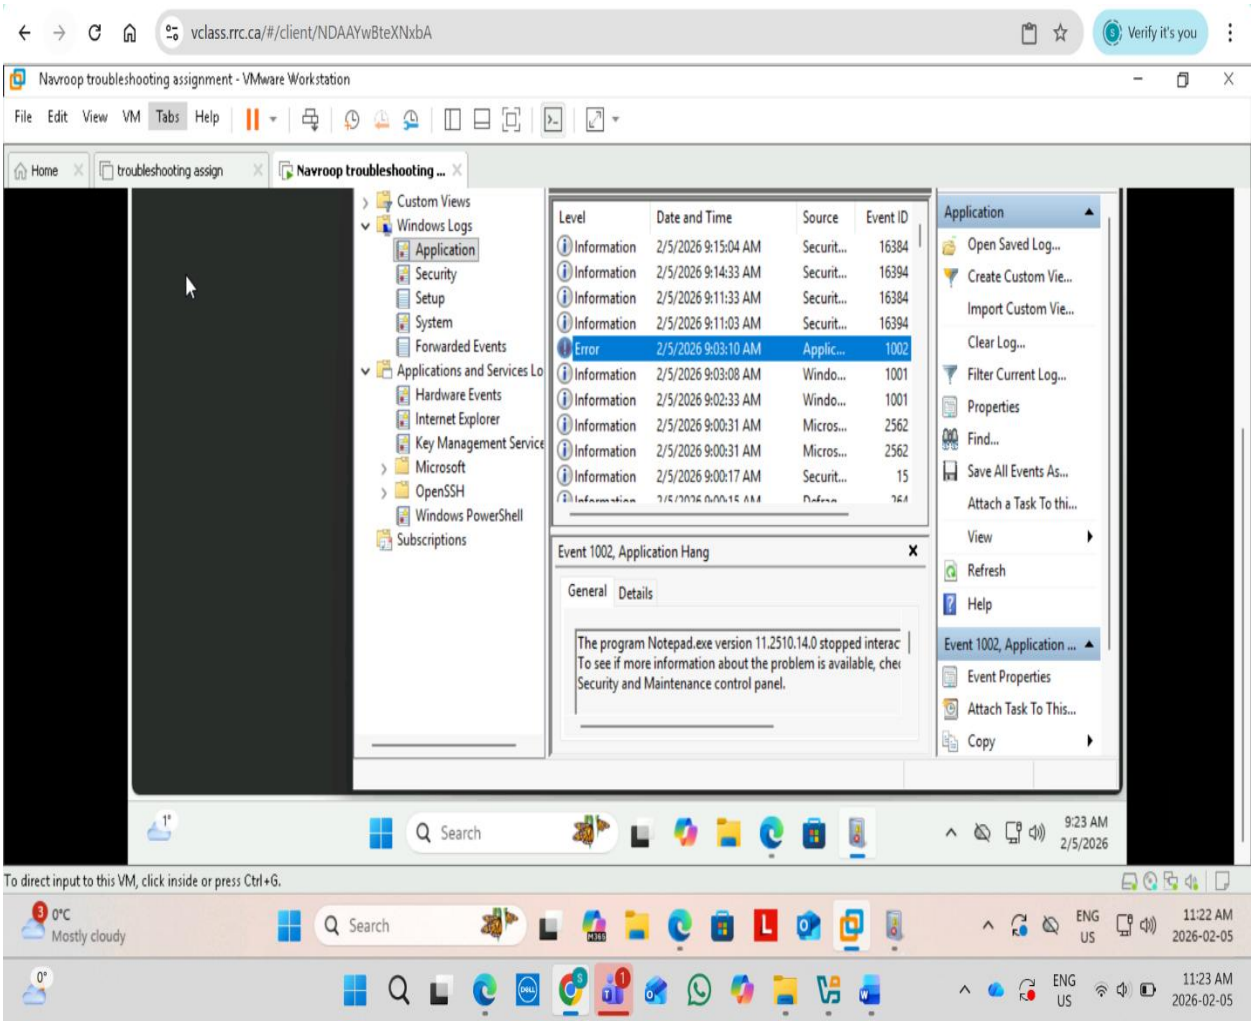

Date : 12-02-2026

Overview

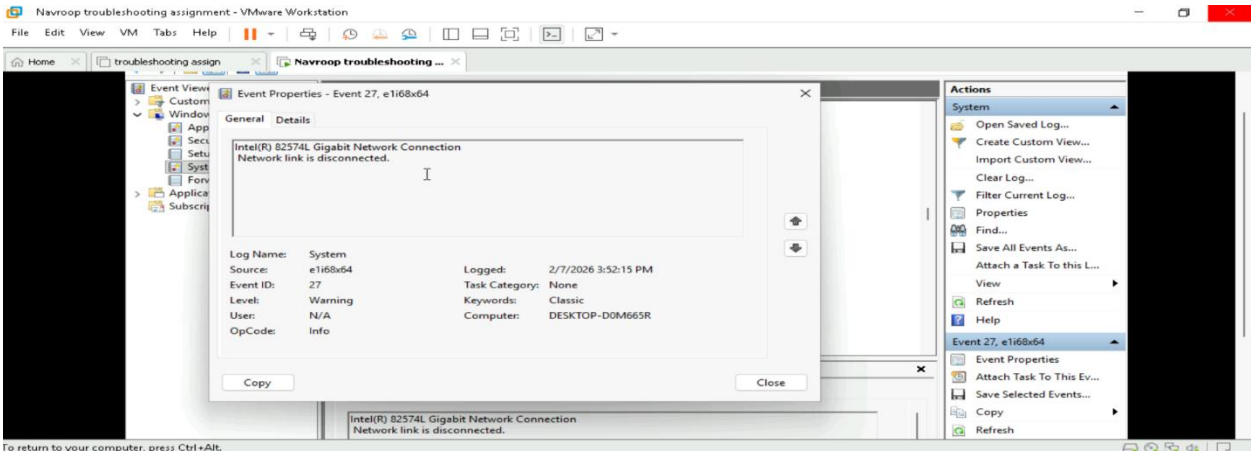

This document provides supporting evidence for the Automated Events Troubleshooting project . It demonstrates practical experience with Windows event logs , system monitoring , security events, and performance analysis.

STEP EVIDENCE SUMARRY

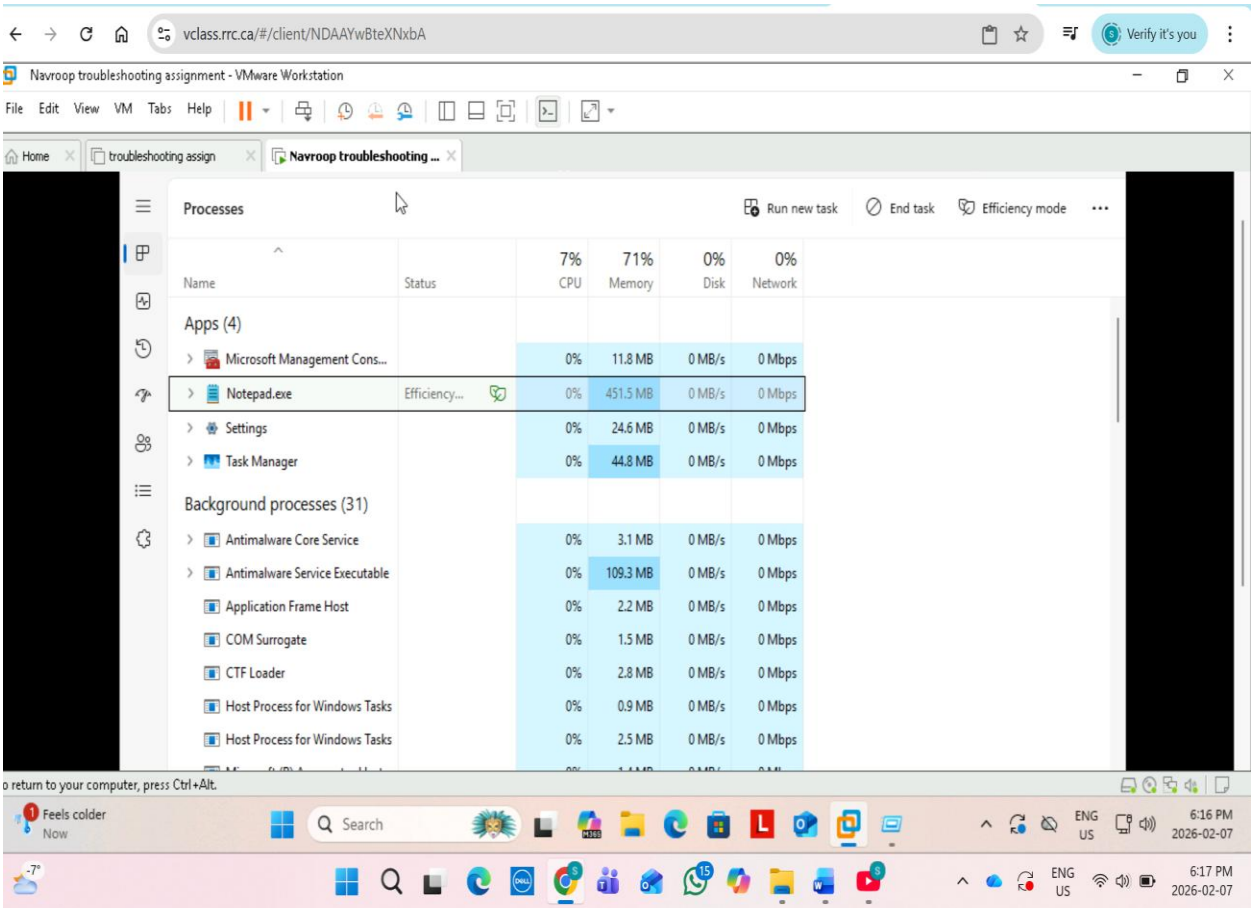

Step 1: Triggered system event entries

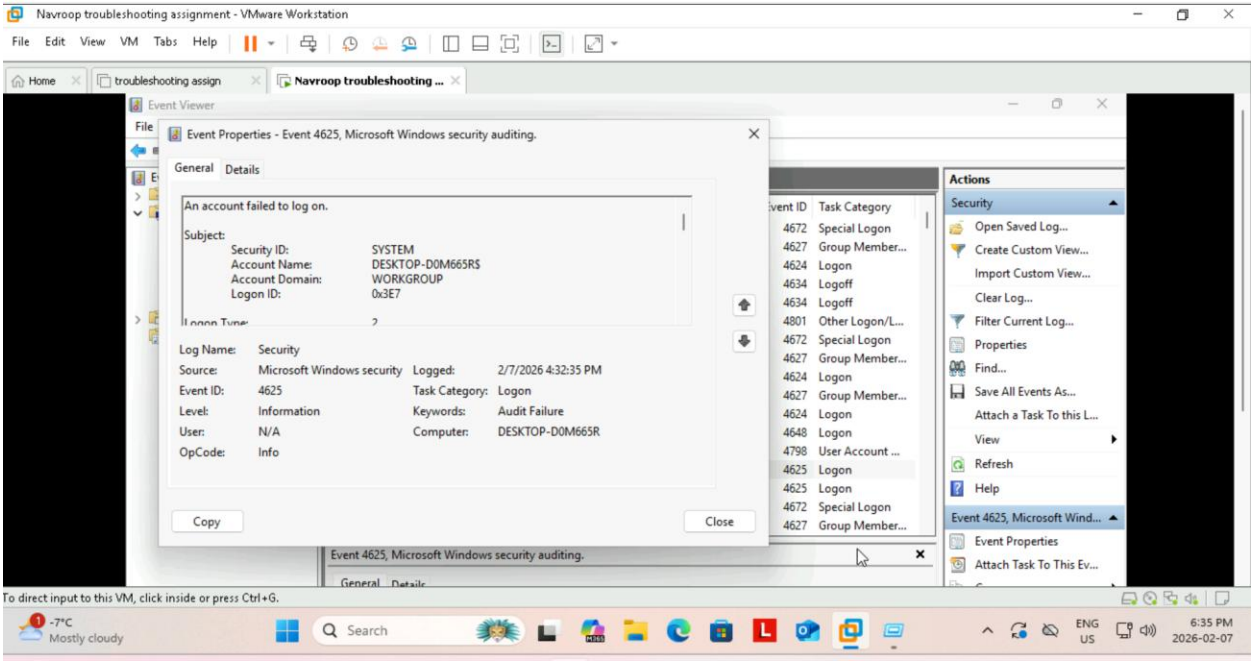

Step 2: Enabled and Disabled WIFI Connection to generate network logs

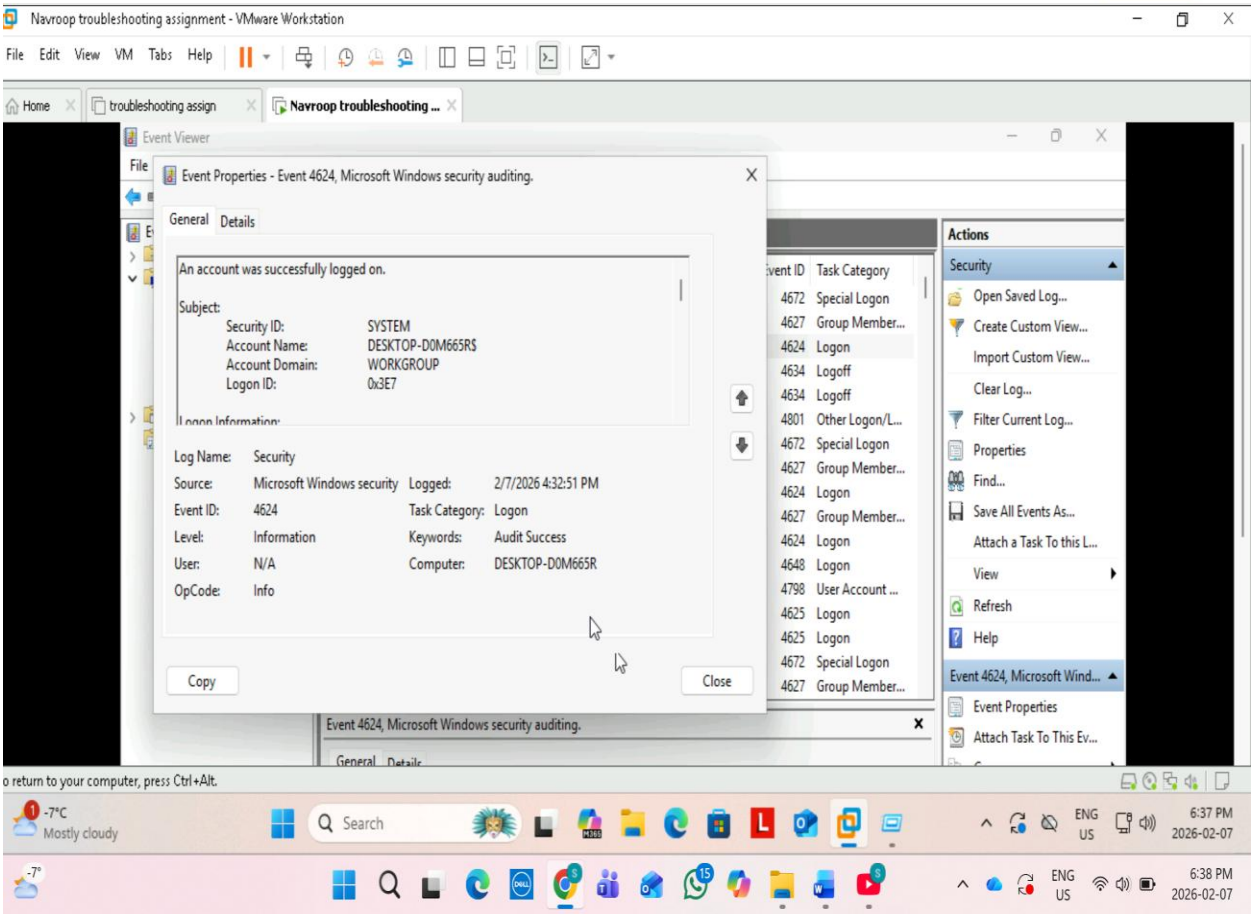

Step 3: Task Manger Monitoring

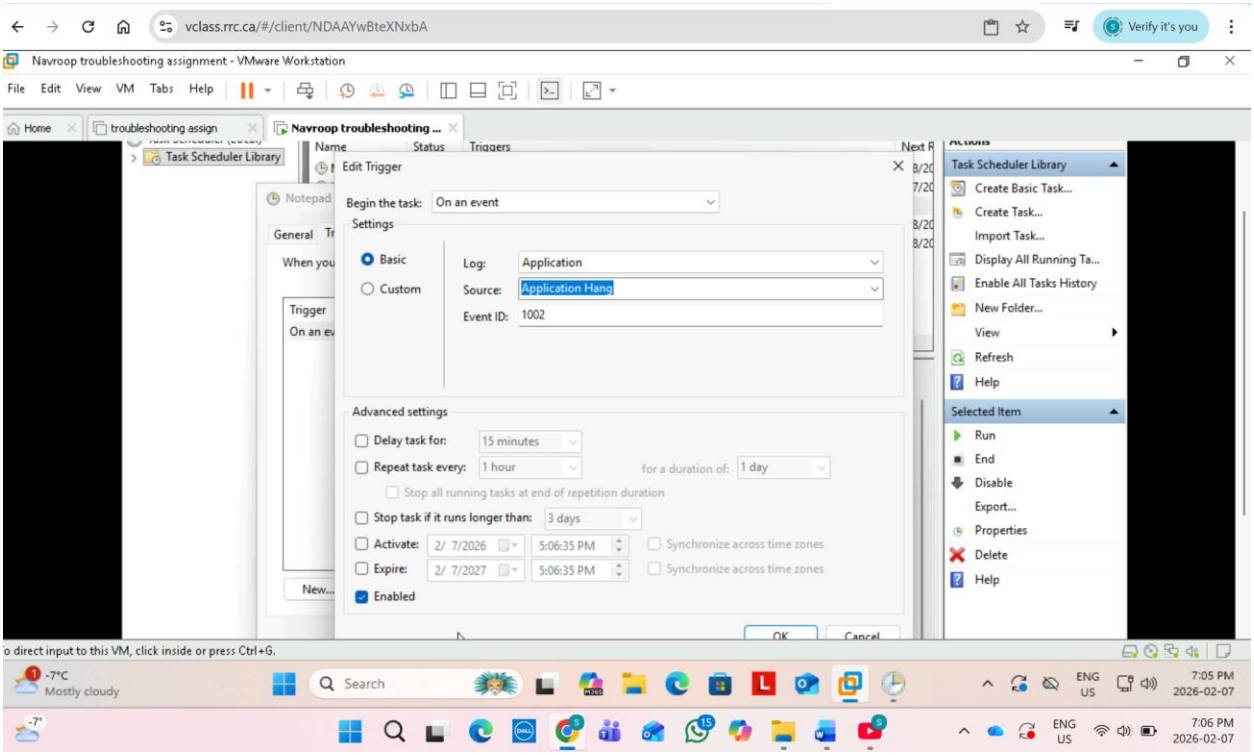

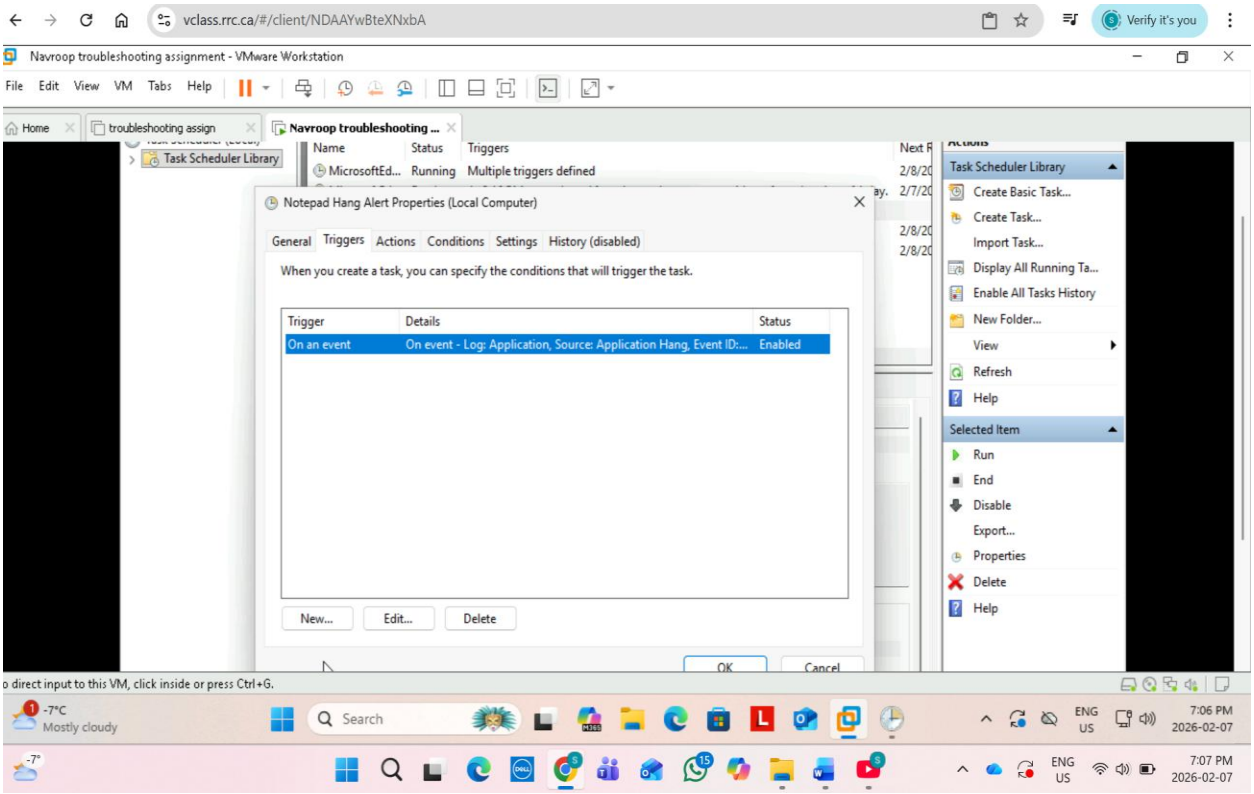

Step 4: Generate Security Events

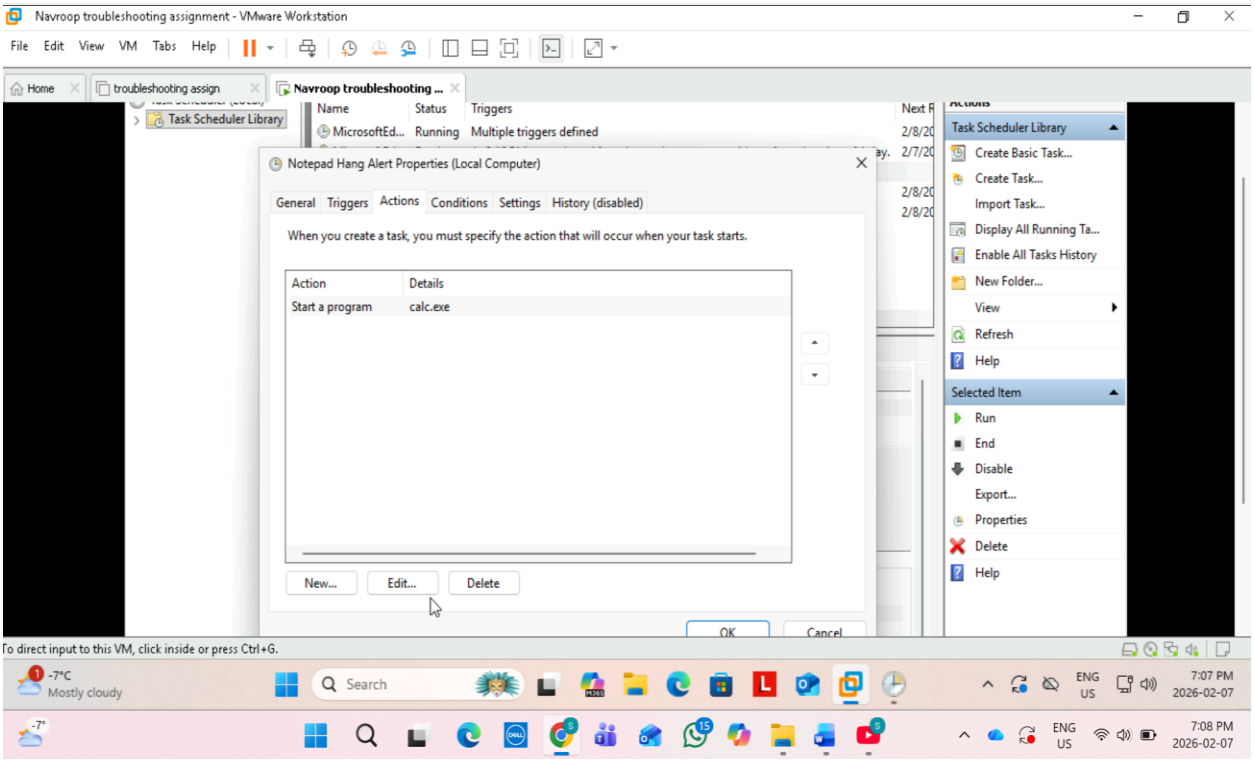

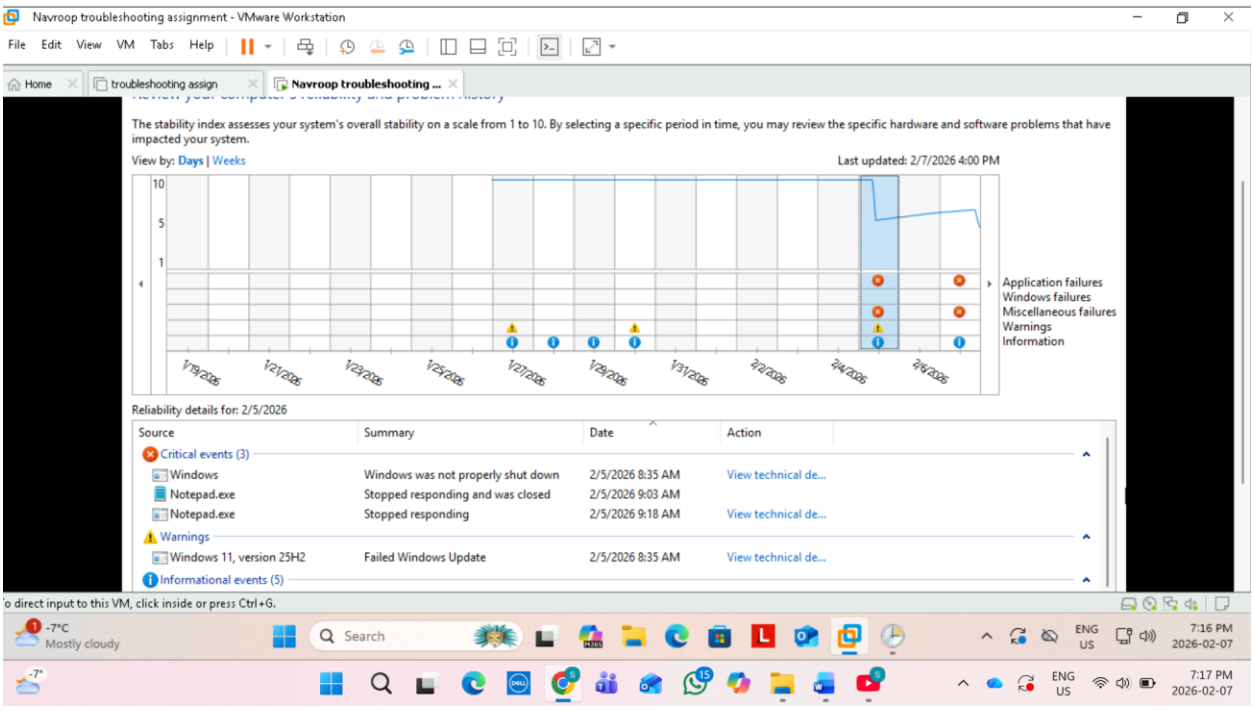

Step 5: Create an alert

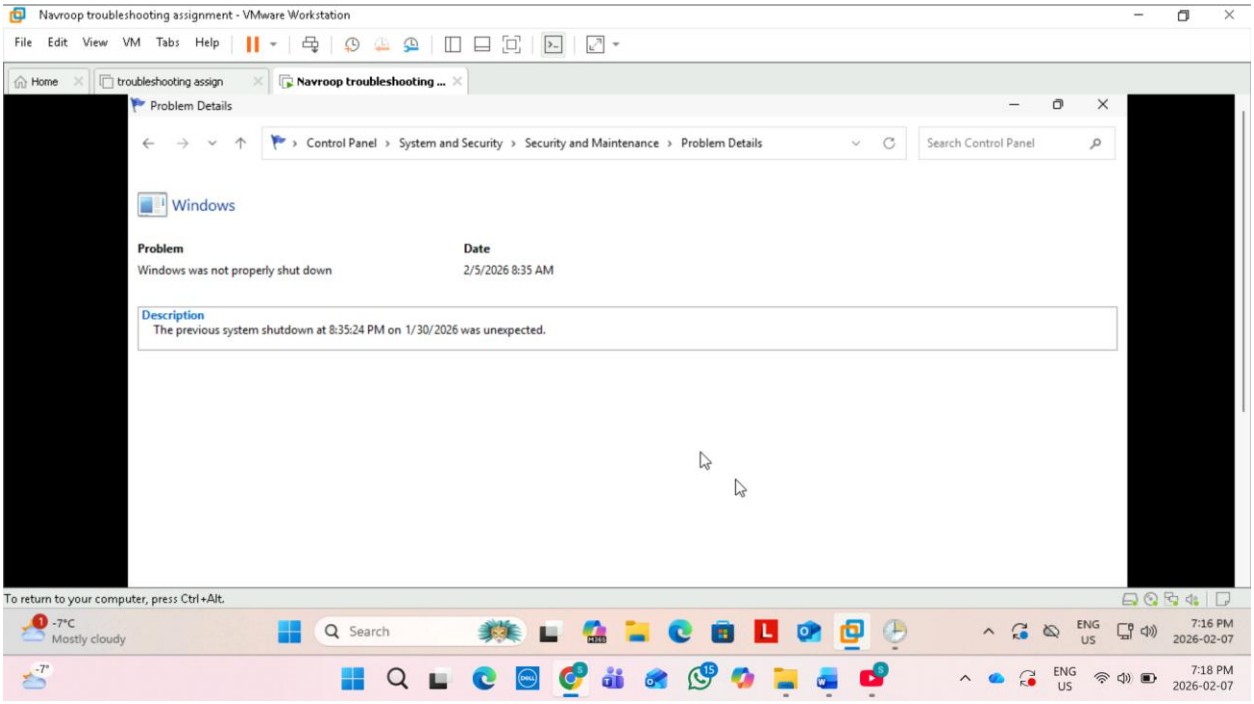

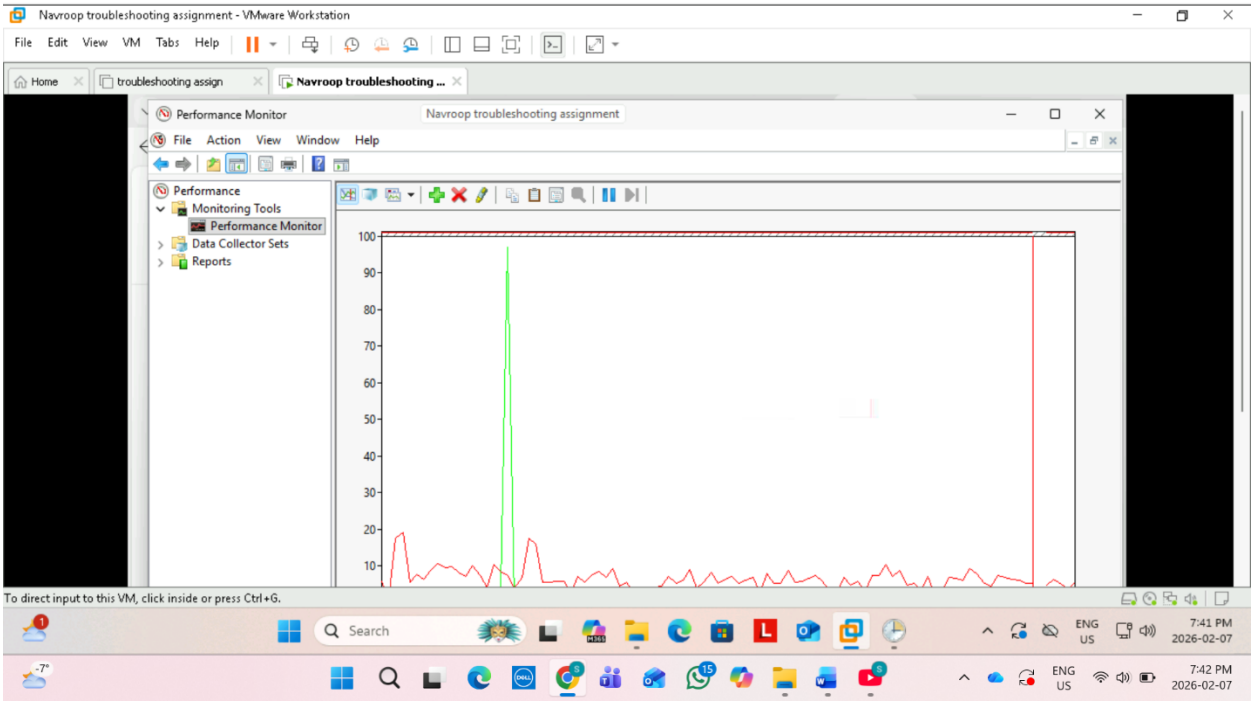

Step 6 : Reliability Monitor Investigation

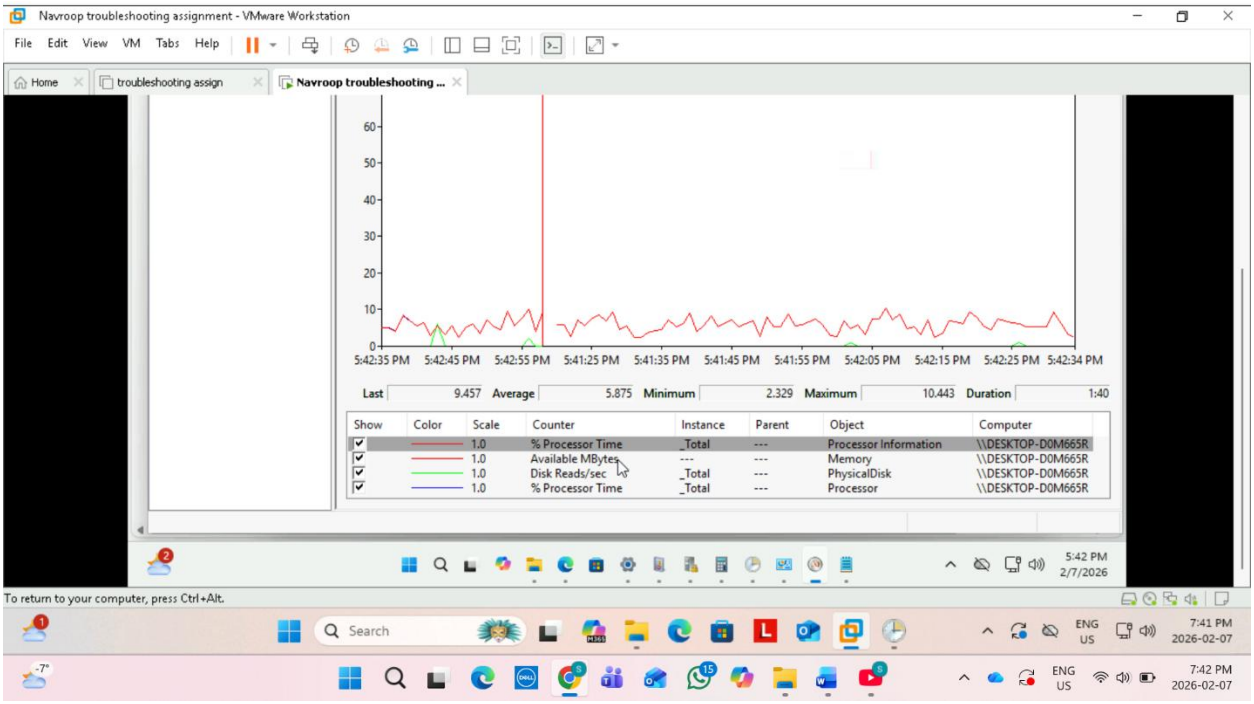

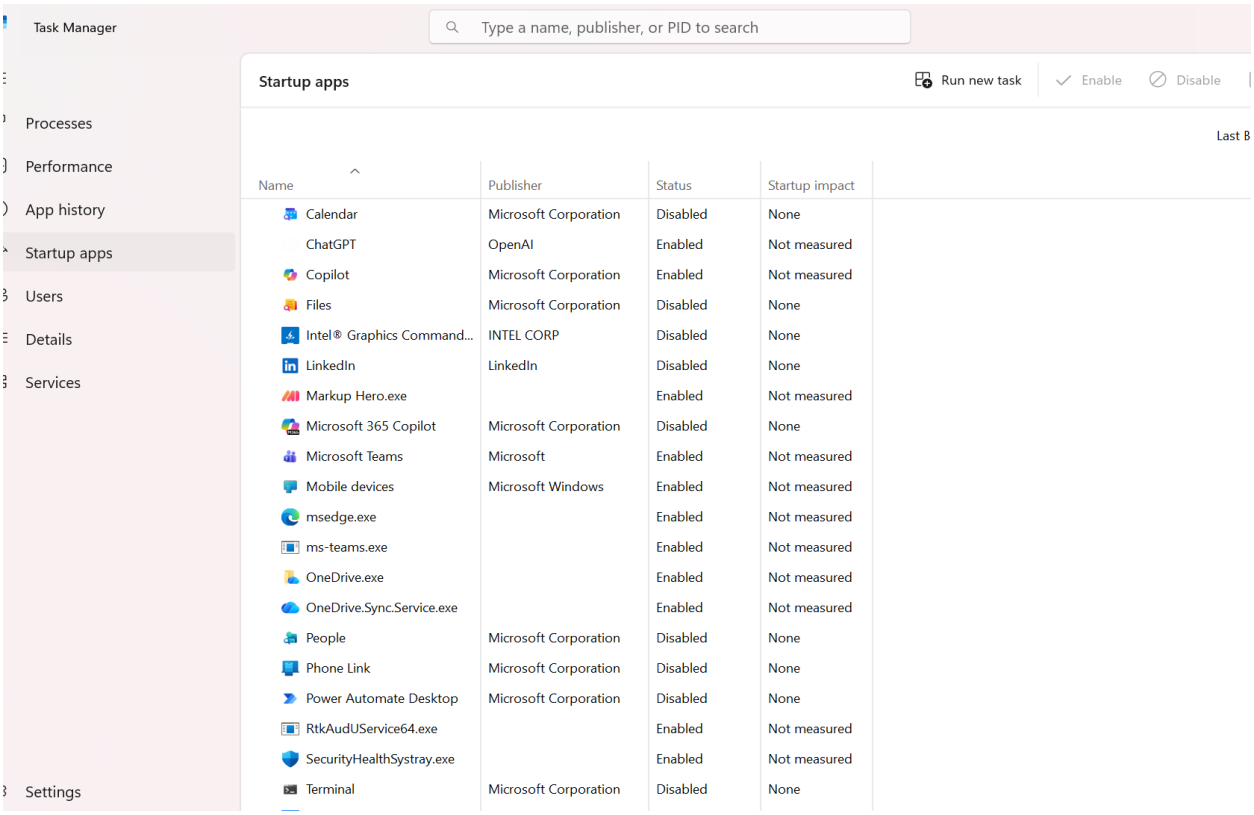

Reliability Monitor recorded a Windows failure on feb 5, 2026 at 8:35AM. The system reported that windows was not properly shut down and the previous shutdown was unexpected. This likely occurred because the virtual machine or computer was turned off without using the normal shutdown process. No other major application events were recorded at that time.

Step 7: Performance Monitor Counters

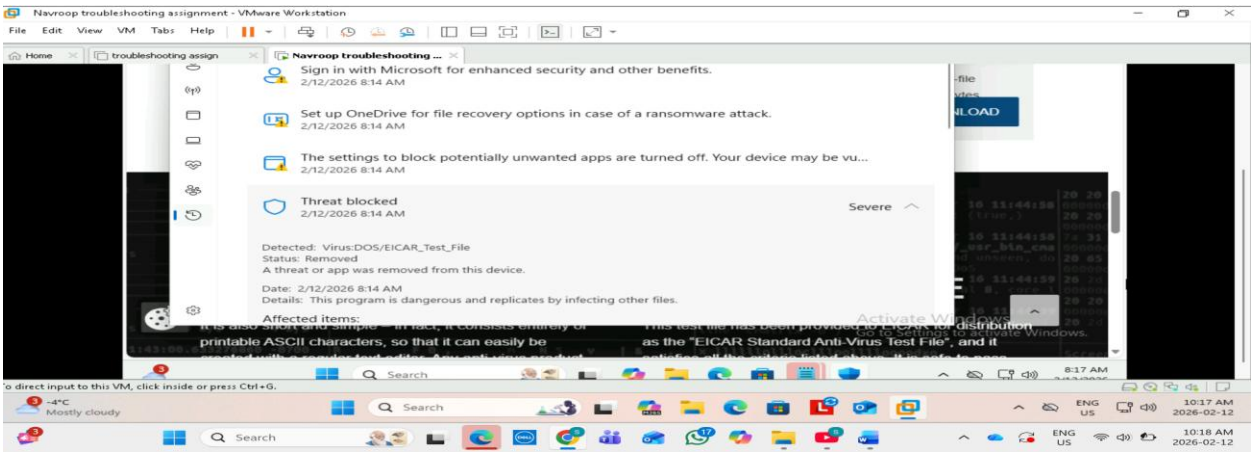

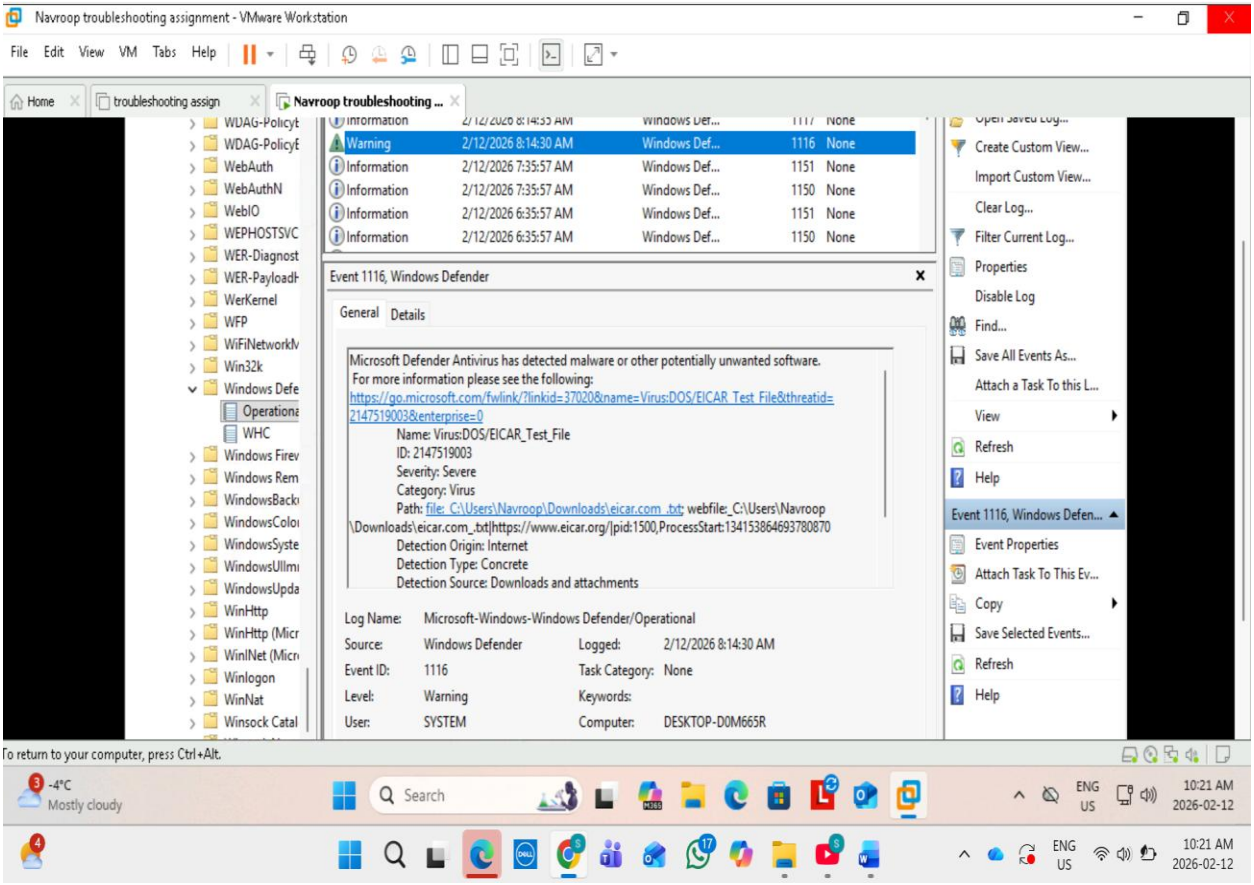

Step 8: Startup Impact Excercise

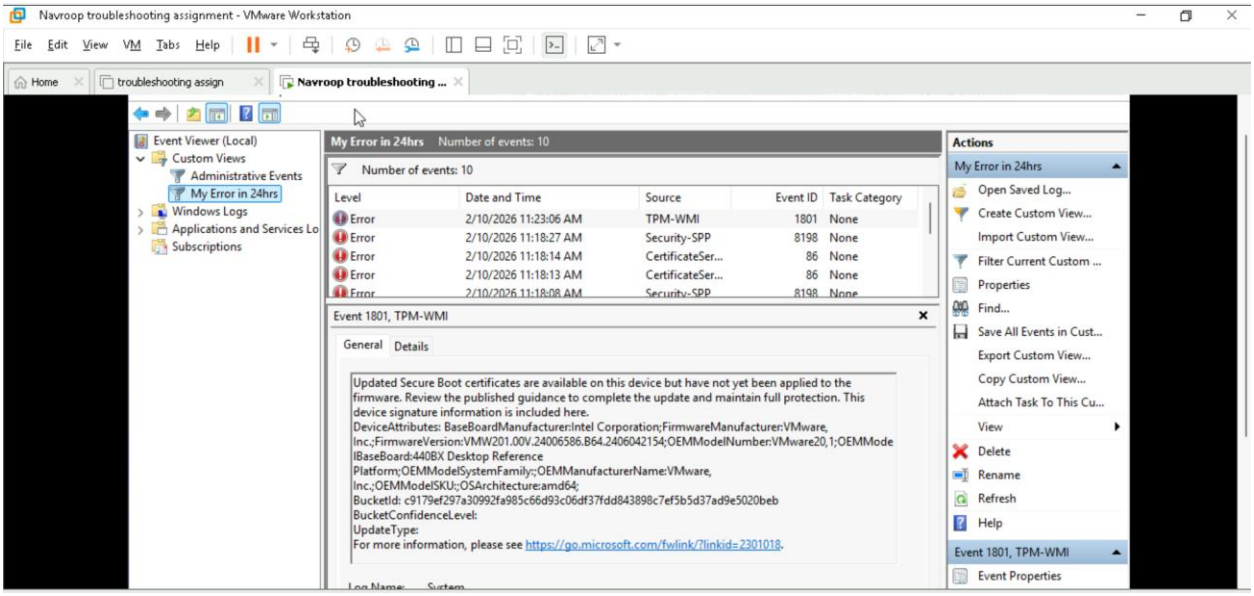

Item	Description	Action (Keep/Disable)
OneDrive.exe	Synchronizes user files and school documents	Keep
Microsoft Edge	Browser preloads at startup and increases boot time.	Disable
Microsoft Teams	Communication app that can be opened manually when needed.	Disable

Step 9: Windows Defender Security logs

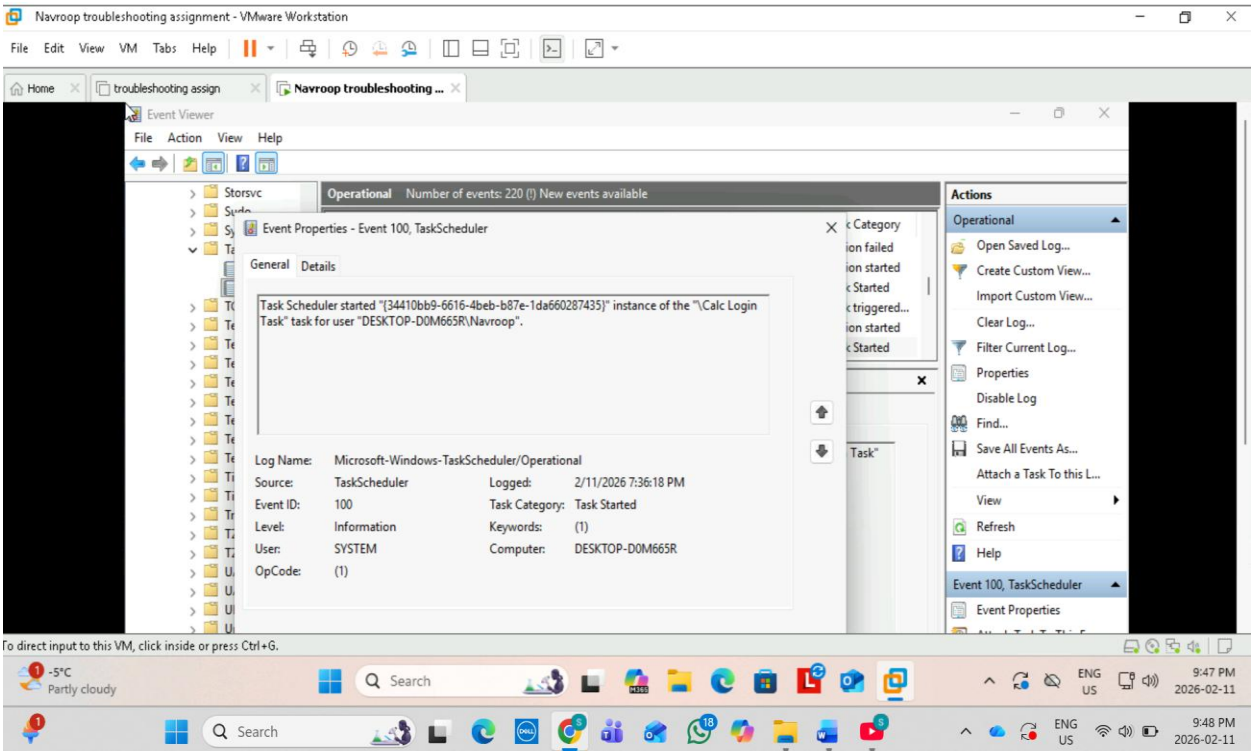

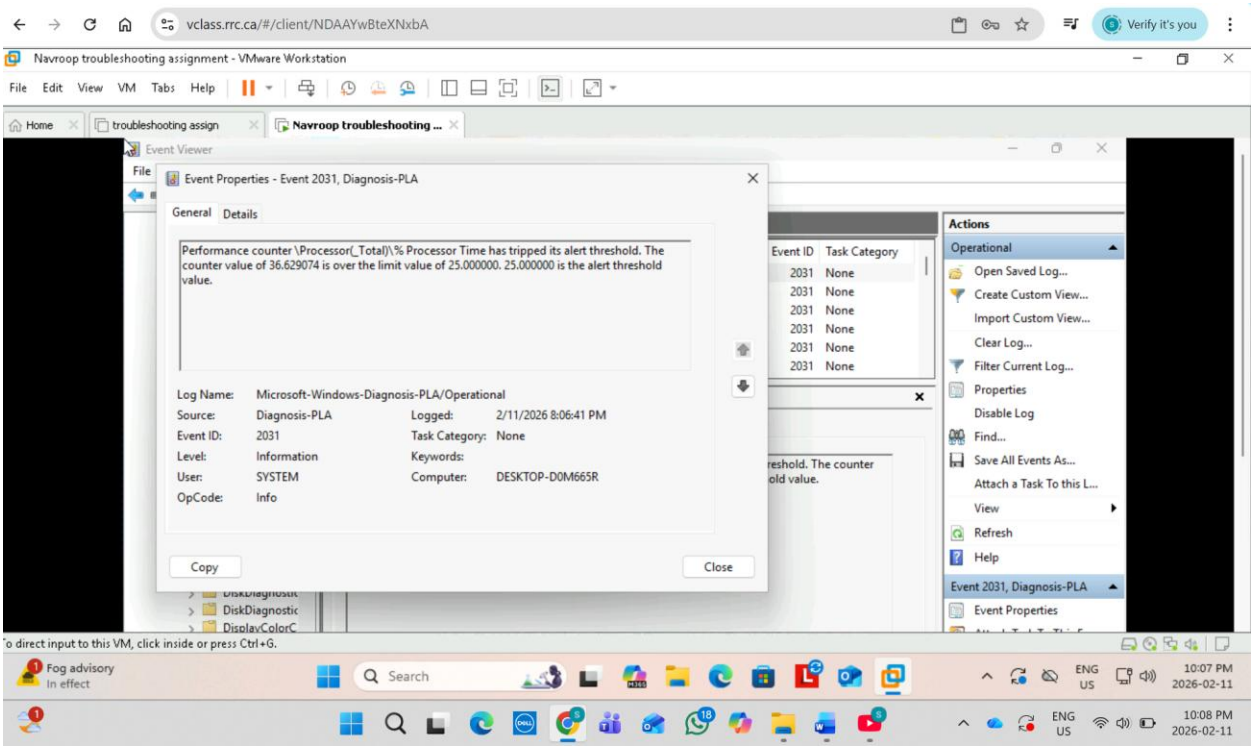

Step 10: Custom log creation

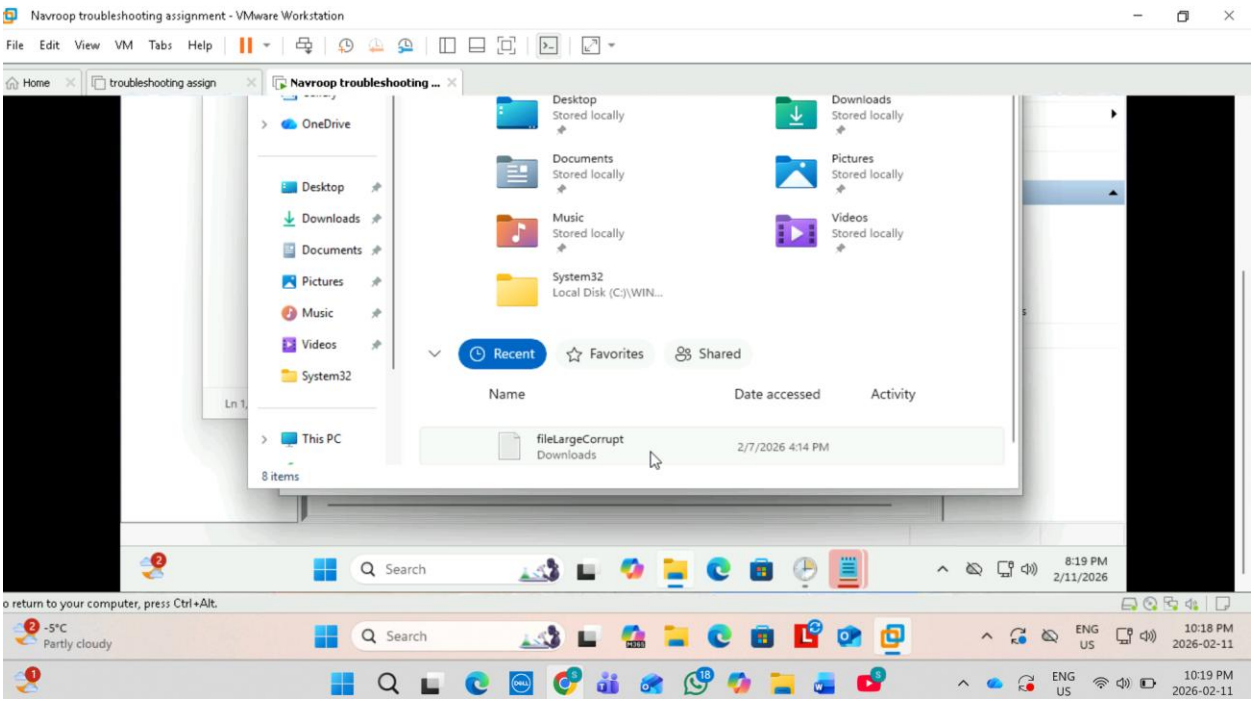

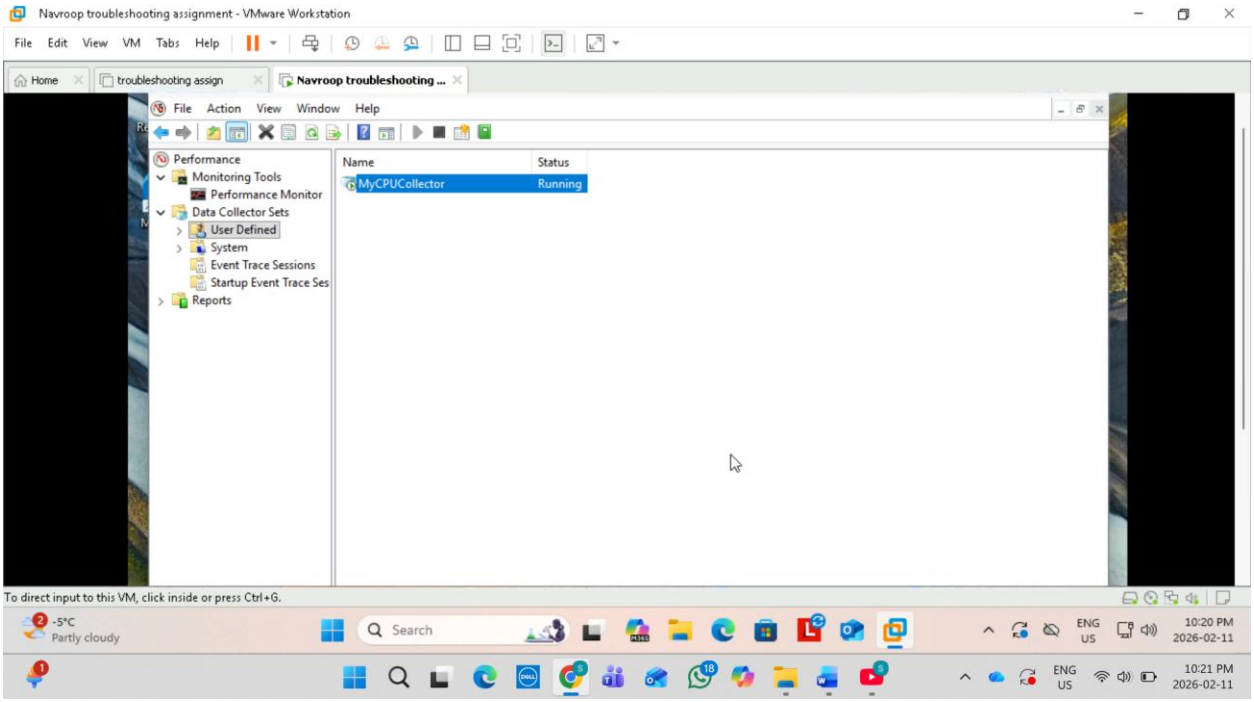

Step 11: Scheduled Task with logging

Step 12: Monitoring + Logging

Conclusion

This project improved my understanding of Windows event logs , system monitoring , and troubleshooting workflows. It also strengthened my ability to analyze system behavior and identify potential issues using built in Windows administrative tools.
